

PALLET FLOW

Pallet Flow provides very high density storage in applications that must have first in, first out storage. With pallet flow the pallets are loaded into the back end of the system and flow to the front end. On systems over 3 pallets deep, a braking system is typically provided.

Typical Applications:

- Food Manufacturing

Advantages:

- FIFO - First In First Out
- High storage density (25+ pallets deep)

Limitations:

- High capital investment
- Requires good pallet quality
- High maintenance requirements
- Limited SKU and selectivity
